Compilar py

Instalar pip install pyinstaller

Crear un archivo requeriments.txt

Tiene que tener las dependencias que tiene el código y la ultima versión del pyinstaller.

Ejemplo para dbf_to_sql.py

```
dbf_to_sql.py > ② sanitize_value

1 import os
2 from datetime import datetime
3 import ast # Para convertir el string de la estructura a lista
4 from dbfread import DBF # Cambiamos dbf por dbfread

5
6 def get_structure_from_txt(filename):
7 """lee la estructura desde el archivo txt"""
```

El fichero requeriments.txt tiene que quedar asi

```
dbfread==2.0.7 Dependencia del Script
PyInstaller==5.13.2 Version PyInstaller
```

Por si no conocemos las versiones instaladas se puede ver asi

```
C:\xampp\htdocs\python\dbfTosql-master\converDBFtoSQL2_20250127_compila lo>pip show dbfread WARNING: Ignoring invalid distribution ~ip (C:\Python312\Lib\site-packages)

Version: 2.0.7

Johnman J. Read DdF Files with Python
Home-page: https://dbfread.readthedocs.io/
Author: Ole Martin Bjorndalen
Author-email: ombdalen@gmail.com
License: MIT
Location: C:\Python312\Lib\site-packages
Requires:
Required-by:

C:\xampp\htdocs\python\dbfTosql-master\converDBFtoSQL2_20250127_compilad >pyInstaller -v

6.11.1

C:\xampp\htdocs\python\dbfTosql-master\converDBFtoSQL2_20250127_compilad>
```

Una vez tenemos el fichero requeriments.txt generado con las dependencias y el pyInstaller

Ejecutaremos la siguiente líneas para instalar las dependencias y poder compilar

C:\>pip install -r requeriment.txt

Saldra algo parecido a esto

```
C:\xampp\htdocs\python\dbfTosql-master\converOBFtoSQl2_20250127_compilado>pip install -r requeriments.txt

```

A continuación podemos compilar el script

C:>pyinstaller --onefile --windowed nombre_del_script.py

--onefile: Crea un solo archivo ejecutable

--windowed: Evita que aparezca una ventana de consola al ejecutar la aplicación.

Se crearan los directorios build y dist.

Dentro de dist esta el ejectuable.
